EMAS or ISO 14001?

Implementing an environmental management system should also be a strategic decision of an organisation, in addition to a quality management system.

An environmental management system focuses on managing and improving performances regarding the environment. Structural attention is paid to the environment in the operational management through an environmental management system. Such a system can be certified according to a standard. It is often decided to certify it according to an international standard, that is to say ISO 14001, but it can also be verified and registered according to the European Environmental Management and Audit Scheme (EMAS).

The requirements of both are virtually identical, however a major difference is that EMAS requires that the organisation periodically provides external information about its environmental performance.

What can Envicas offer you?

Choosing Envicas means choosing tailor-made work.

Envicas bvba offers you strategic and operational support during the entire certification process.

Depending on the resources and your wishes, we can carry out the set-up and implementation of the system in its entirety or play a coordinating or advisory role.

We have advisors with experience in setting up and implementing environmental management systems who are also recognised as internal auditor and as lead assessor ISO 140001.

Choosing Envicas means choosing tailor-made work
